

A Practical Study of PDF Translation

Example Author - author@example.com

This study evaluates a local-first PDF translation workflow. The experiment uses 25 mg of material at 20 C and reports an accuracy of 96%. Project documentation is available at <https://example.com/research>. The simplified energy relation is $E = mc^2$ and the method follows reference [12].

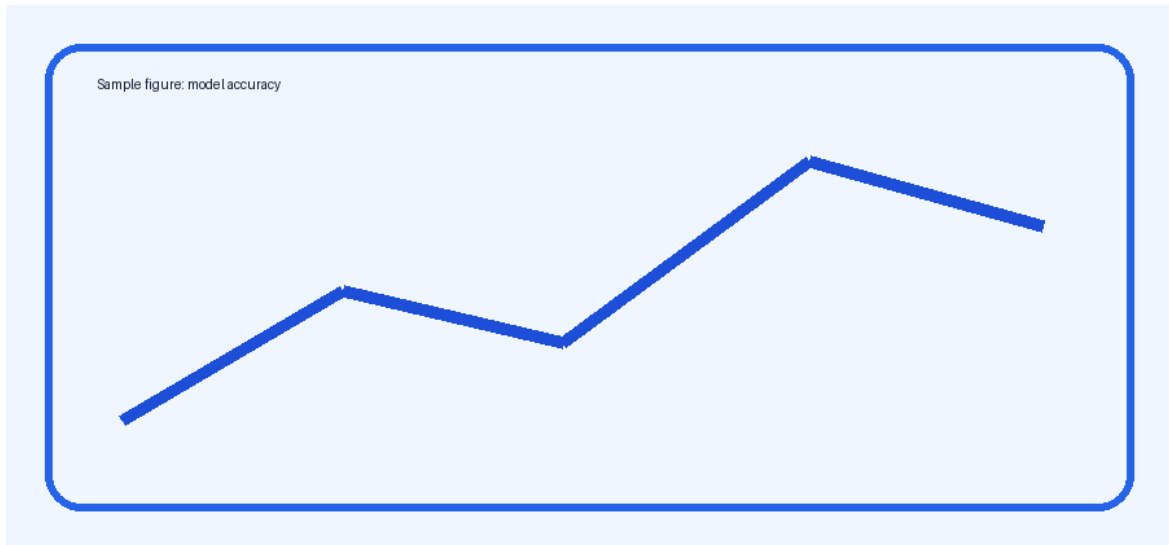

Figure 1. Accuracy improves during training.

1. Introduction

PDF files combine text, fonts, vector graphics, raster images, and page geometry. A safe translator should preserve content even when the original layout cannot be reused. For that reason, this MVP generates readable flow-layout pages and a bilingual review file.

2. Two-column extraction example

The left column contains the first part of the reading order. Segments receive stable task-local identifiers and numeric row keys. URLs, e-mail addresses, references, code, and units are protected before export.

The right column contains the second part. Returned spreadsheets are validated for missing rows, duplicate keys, empty translations, changed numbers, and damaged placeholders. Blocking errors must be fixed before PDF generation.

Mode	Overlap risk	Readable
Fixed box	High	Sometimes
Flow layout	Low	Yes
